jan

plese perform a sequence and a sequence interference search for

ussn 09 / 754004

SEQ ID NO: 1

SEQ ID NO: 2

thanx

phillip gambel art unit 1644 308-3997

Room 8803

1644 mailbox 9e12

or i can pick up when ready. thanx

christina

please okay rush

sorry, i thought i had sequence search done already on this one

thanx

Jan Delaval Reference Librarian Biotechnology & Chemical Library CM1 1E07 – 703-308-4498 jan.delaval@uspto.gov

It can also act synergistically with interferon ga C;Comment: TNF-alpha and beta (lymphotoxin) are the products of different genes ut are produced by different cell types and have different induction kinetics.

-: FUNCTION: Cytokine that binds to TMPRSFIB/TMPRI and
TMPRSFIB/TMPBR. It is mainly secreted by macrophages and can induce cell death of certain tumor cell lines. It is potent pyrogen causing fever by direct action or by stimulation of interleukin 1 secretion and is implicated in the induction of cachexia, Under certain conditions it can stimulate cell proliferation and induce cell differentiation.

-: SUBCULULAR LOCATION: Type II membrane protein. Also exists as extracellular soluble form derives from the membrane form by

-: PTM: The soluble form derives from the membrane form by

         MIN
                       FUNCTION: Cytokine that binds to TNFRSF1A/TNFR1 and TNFRSF1B/TNFBR. It is mainly secreted by macrophages and can induce cell death of certain tumor cell lines. It is potent pyrogen causing fever by direct action or by stimulation of interleukin 1 secretion and is implicated in the induction cachexia, Under certain conditions it can stimulate cell proliferation and induce cell differentiation.

SUBUNIT: Homotrimer (By similarity).

SUBCELLULAR LOCATION: Type II membrane protein. Also exists extracellular soluble form (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             \vdash

Also exist extracellular soluble form (By similarity).

PTM: The soluble form derives from the membrane form by proteolytic processing (By similarity).

PTM: The membrane form, but not the soluble form, is phosphorylated on serine residues. Dephosphorylation of the membrane form occurs by binding to soluble TNFRSF1A/TNFR1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         J Vet. Res. 65:233-240(2001).
FUNCTION: Cytokine that binds to TNFRSF1A/TNFR1 and TNRRSF1B/TNFBR. It is mainly secreted by macrophages induce cell death of certain tumor cell lines. It is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SIMILARITY: BELONGS TO THE TUMOR NECROSIS FACTOR FAMILY

L. Submitted (XXX-1993) to the EMBL/GenBank/DDBJ databases.

C. -!- FUNCTION: Cytokine that binds to TNFRSF1A/TNFR1 and

TNFRSF1B/TNFBR. It is mainly secreted by macrophages and can induce cell death of certain tumor cell lines. It is potent pyrogen causing fever by direct action or by stimulation of interleukin 1 secretion and is implicated in the induction of cachexia, Under certain conditions it can stimulate cell proliferation and induce cell differentiation.

C. -!- SUBCLIULAR LOCATION: Type II membrane protein. Also exists as extracellular soluble form (By similarity).

C. -!- PTM: The soluble form derives from the membrane form by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches

It is mainly secreted by macrophages and can induce cell death of certain tumor cell lines. It is potent pyrogen causing fever by direct action or by stimulation of interleukin 1 secretion and is implicated in the induction of cachexia, Under certain conditions it can stimulate cell

DISEASE: CACHEXIA ACCOMPANIES A VARIETY OF CANCER AND INFECTION, AND IS CHARACTERIZED
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 proliferation and induce cell differentiation.

SUBJUNT: Homotrimer (By similarity).

SUBCELLULAR LOCATION: Type II membrane protein. Also exist extracellular soluble form (By similarity).

PTM: The soluble form derives from the membrane form by proteolytic processing (By similarity).

PTM: The membrane form, but not the soluble form, is phosphorylated on serine residues. Dephosphorylation of the membrane form occurs by binding to soluble TNFRSF1A/TNFRI in the soluble to membrane form occurs by binding to soluble TNFRSF1A/TNFRI
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      s SWISS-PROT entry is copyright. It is mainly secreted by macrophages and can induce cell death of certain tumor cell lines. It is potent pyrogen causing fever by direct action or by stimulation of interleukin 1 secretion and is implicated in the induction of cachexia, Under certain conditions it can stimulate cell proliferation and induce cell differentiation.

SUBCULTURAR INCAPTION: Type II membrane protein. Also exists as extracellular soluble form (By similarity).

PTM: The soluble form derives from the membrane form by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           SIMILARITY: BELONGS TO THE TUMOR NECROSIS FACTOR FAMILY.

TISSUE=Ovarian follicle; Wang B., Zhang Y.; "Goat ovarian TNF alpha "Goat ovarian TNF alpha cDNA Submitted (JUN-2000) to the H Goldstein I.M., Henner D., Submitted (MAR-1989) to th SEQUENCE OF 44-234 FROM N.A. SEQUENCE OF 41-234 FROM N.A. follicle; to the Talhouk A.; EMBL/GenBank/DDBJ databases EMBL/GenBank/DDBJ sequence."; databases

Submitted (JAN-1994) to the EMBL/GenBank/DDBJ databases.

-I-FUNCTION: Cytokine that binds to TNFRSF1A/TNFR1 and

-TNFRSF1B/TNFBR. It is mainly secreted by macrophages
induce cell death of certain tumor cell lines. It is Rimstad E TISSUE-Blood; SEQUENCE OF 75-234 FROM N.A. pyrogen causing fever by direct action or by stimulation of interleukin 1 secretion and is implicated in the induction cachexia. Under certain conditions it can stimulate cell and potent can of

÷ proliferation and induce cell differentiation.
SUBUNIT: Homotrimer (By similarity).
SUBCELULLAR LOCATION: Type II membrane protein. Also exists extracellular soluble form (By similarity).
PM: The soluble form derives from the membrane form by proteolytic processing (By similarity).
PTM: The membrane form, but not the soluble form, is phosphorylated on serine residues. Dephosphorylation of the membrane form of the soluble form of the membrane form of the phosphorylated on serine residues. as an

: membrane form ocurrs by binding to soluble TNFRSF1A/TNFR1 (Ву

Similarity).

DISEASE: CACHEXIA ACCOMPANIES A VARIETY OF CANCER AND INFECTION, AND IS CHARACTERIZED DISEASES,
BY GENERAL GENERAL INCLUDING $_{
m ILL}$ HEALTH

AND MALNUTRITION.
SIMILARITY: BELONGS TO THE CAUTION: Ref.2 sequence dif trameshift in position 60. TIMOR NECROSIS FACTOR FAMILY.

but preferably by intravenous injection or infusion. Usual doses are 0.01-100 (especially 1-40) mg/kg/day, in 1-6 portions or in sustained release form. Further doses may be given, just before or during relapse. Inhibition of TNF alpha by Ab alleviates some of the systemic toxicity eslocated with administration of IL-2 (which increases the level of CD4+ cells but also stimulates production of TNF, high levels of which cause unwanted inflammatory and immunological responses). Blockade of TNF allows administration of higher doses of IL-2 than would be otherwise
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         WPI; 1995-168947/22.

                                                                                                                                 factor (TNF) for the treatment of vascular disease, cardiovascular disorders, thrombotic disorders, or illnesses or pathologies which can be treatable by decreasing plasma fibrinogen. Typical conditions which can be treated include acute myocardial infarction, deep vein thrombosis, thrombothebitis, stroke, thromboembolic disorder or ischemic events. In one embodiment the antagonist used is an anti-TNF antibody (optionally chimeric, humanised or resurfaced), preferably one which bluds to an epitope comprising at least 5 amino acids within the region TNF-alpha 87-108 and/or TNF-alpha 59-80. The present sequence represents the 59-80 epitope.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This peptide sequence is a fragment of tumour necrosis factor-alpha length protein. This region is an epitope and is recognized and/or binds with anti-TWR activity. This fragment is used to describe a novel method of treating or preventing acquired immune deficiency disease and infection with human immune deficiency virus (HIV) by co-administration of interleukin-2 (IL-2) and a chimeric antibody (Ab), or its fragment, against tumour necrosis factor (TWR). IL-2 and Ab are administered by injection, orally, topically or are produced from gene therapy vectors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Tumour necrosis factor-alpha; epitope; human immunodeficiency virus; HIV; Thr8-alpha; anti-Thr8; antibody; treatment; prevention; infection; acquired immune deficiency disease; interleukin-2; IL-2; gene therapy; systemic toxicity; CD4+ cell; inflammation; immune response.
